So, you've had COVID-19... Now what?

Tim Amass, MD, ScM
Assistant Professor of Medicine
Division of Pulmonary Sciences and Critical Care Medicine
University of Colorado School of Medicine
Department of Veterans Affairs, Eastern Colorado Health Care System

Disclosures

• No relevant disclosures

Objectives

- Discuss pulmonary complications of COVID after discharge from the hospital
 - Evaluate a case from Colorado as an example
- Review lessons from other respiratory infections as it pertains to lung function
- Outline the sparse literature to date as it pertains COVID and lung function

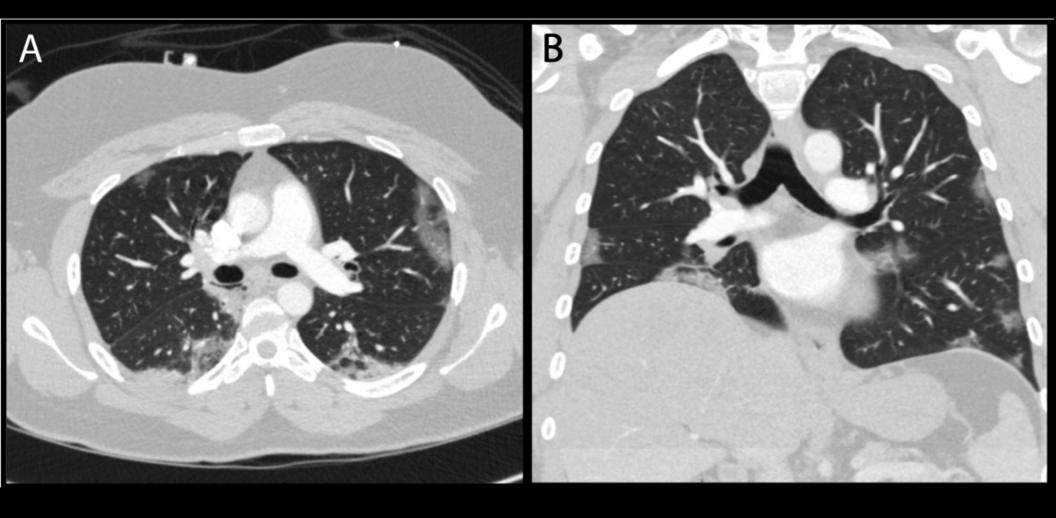

Case

- 28 year old obese male, previous short term smoker, admitted to the ICU at the beginning of April with COVID+
 - Required high flow nasal cannula 15L and greater
 - Required self-proning
 - No exposure to invasive or non-invasive mechanical ventilation
 - Treated with hydroxycholorquine and supportive care
- Clinically improved and sent home on 2 liters per minute of oxygen

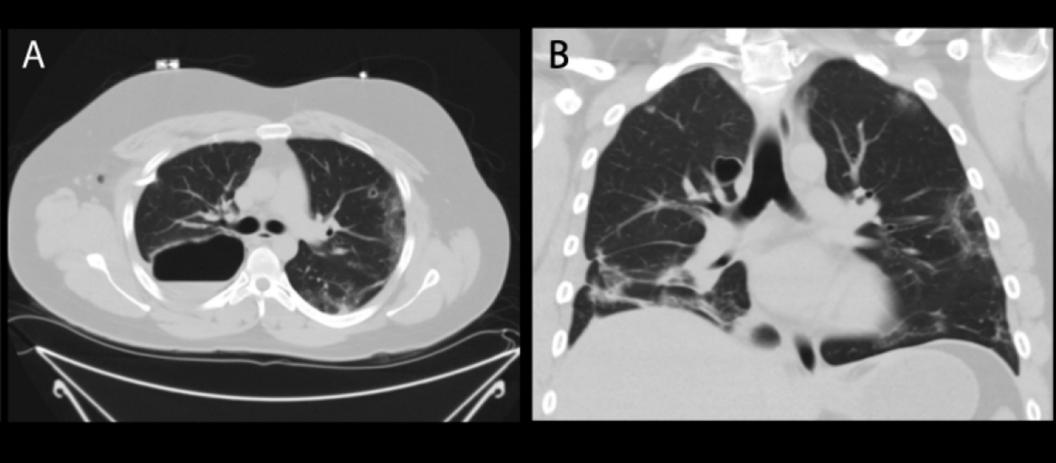

Case Continued

- Two weeks later, presents to the emergency department with acute onset chest pain, shortness of breath, and scant hemoptysis
- Chest X-Ray with right sided pneumothorax, treated with tube thoracostomy. This rapidly resolved, and the next day discharged home.
- 2 days later he returns to the ED with the same symptoms and computed tomography (CT) is performed

Initial Scan

Follow-up Scan

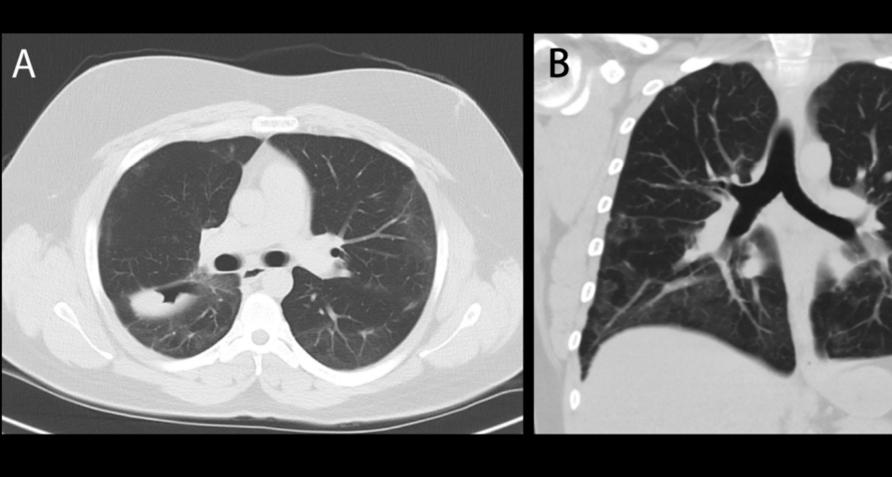

Follow-Up Scan

Clinical Course

- All infectious data, including HIV and fungal studies were negative
- Pneumothorax resolved at 5 days, chest tube removed
- Pneumatoceles appeared smaller
- Had one month follow up CT scan:

One Month Later

Pneumatoceles (PTC) and Pneumothoraces (PTX)

- Seen in a number of conditions, including during previous viral epidemics
 - Subpleural pneumatoceles and PTX seen during H1N1, and previous SARS (1)
 - In these case, often during hospitalization
 - Most often associated with mechanical ventilation
- With COVID-19 Pandemic
 - Reports of PTC and PTX during hospitalizations, in addition to peripheral ground glass (2,3)
 - Increasing reports of PTC and PTX after hospitalization as demonstrated here
 - Highlight in this case was without mechanical ventilation

Mo, X et al. European Respiratory Journal 2020

Summary

- Pulmonary Consequences of COVID-19
 - Seeing pneumatoceles and pneumothoraces
 - In and Out patient
 - Patients exposed and not exposed to mechanical ventilation
 - Reduction in pulmonary function
 - Decrease appears worse in more severe disease
 - Most "quality" literature at this stage is just at/post discharge, need follow up data
 - Previous SARS/MERS epidemics demonstrated reduced lung function (DLCO, volumes, flow) with most notable impact on diffusion capacity
 - Discharge data for COVID-19 in line with that
